Module 2: "SOLID in Practice"

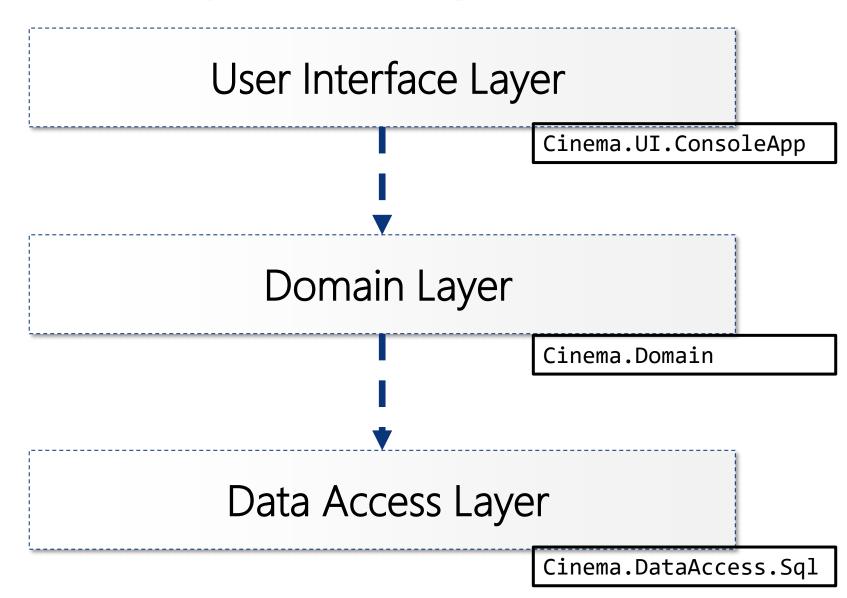

- Discussion: Evaluating the Design
- Pattern: Repository (with Entity Framework)
- Workshop A.2: Data Access Layer with Repository
- Discussion: Evaluating the Design Again
- (Optional) Automatic Testing
- Workshop A.3: Test Domain and Change Data Access

Beautiful Layered Design?

Discussion:

Evaluating the Design

- Can we change the UI Layer from Console to e.g. Web or WPF?
- Can we unit test the Domain Layer?
- Can we change the Data Access Layer?

Anti-Pattern: Entourage

When A depends upon B, and you group B and C in the same assembly, then if C depends upon D, in effect, you have equipped A with a dependency upon D.

Outline

- If you keep the interfaces and implementations in the same assembly, you essentially inherit dependencies' dependencies.
- Entourage means ask for one assembly and it gives all its assemblies.
- Nuget packages are potentially evil!

Better SOLID Design

Workshop A.2: Data Access Layer with Repository

- Discussion: Evaluating the Design
- Pattern: Repository (with Entity Framework)
- Workshop A.2: Data Access Layer with Repository
- Discussion: Evaluating the Design Again
- (Optional) Automatic Testing
- Workshop A.3: Test Domain and Change Data Access

Discussion:

Evaluating the Design

- Can we change the UI Layer from Console to e.g. Web or WPF?
- Can we unit test the Domain Layer?
- Can we change the Data Access Layer?

Pattern: Stairway

- Let your implementation packages depend upon packages that exclusively contain interfaces (or interface-like classes). Moreover, your packages should not depend other implementation packages.
- Outline
 - This is essentially the "module" part of DIP
 - Avoids the Entourage anti-pattern
 - May not always be practically manageable
- See: "Adaptive Code" (2nd Edition) Gary McLean Hall (2017)

Implications of Stairway

- Keep the interfaces and implementations in the different assemblies
 - Can vary the two independently
 - clients only need to make a single reference—to the interface assembly.
- Interfaces should not have any external dependencies
 - As far as possible, this should always be adhered to
- Interfaces should not have methods or properties that expose any data objects or classes defined in thirdparty references
 - A reference to infrastructural entities (i.e. third-party dependencies) should be avoided.

Unfortunately...

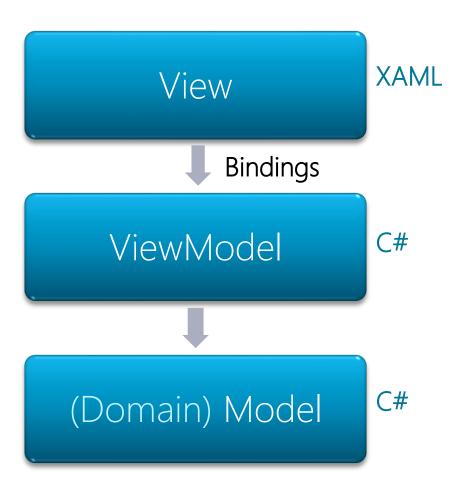

Third party library such as Log4Net, NHibernate, and MongoDB are packaged using the Entourage antipattern.

Solution:

To work around the above issue, make use of a simple interface that hides the third-party dependency behind a first-party dependency and an adapter

Pattern: Model-View-ViewModel

 Separation between presentation and application logic

The ViewModel is an abstraction of the View

 Depends heavily on data binding and command binding

Stairway Design
